REFLECTION

Corroz, Divina Gracia M

BSIT-3A

Creating my own web portfolio has been a challenging yet fulfilling experience. At the beginning of the process, I found myself struggling to fully understand some of the functions I needed to implement. Certain technical aspects felt confusing and, at times, overwhelming. I had to take time to research, experiment, and sometimes redo parts of the code just to make sure everything worked as it should. It wasn't always easy, but it was a learning curve that pushed me to improve my problem-solving skills and patience.

Despite the difficulties, I was proud to have completed the task of adding specific functions to each section of my portfolio. Seeing everything come together from the about section to the contact form gave me a strong sense of accomplishment. It showed me that even when things seem complicated at first, persistence and effort can lead to success. I also have learnt to use git to upload my files on my Github repository easily. It was tough to understand at first but I got used to familiarising the git commands eventually.

One part of the process that I especially enjoyed was designing the layout of my portfolio. I found a lot of joy in choosing the colors, arranging the sections, and experimenting with different animations. Playing around with visual elements and seeing the page come to life was incredibly exciting. It allowed me to express my creativity and personalize the project in a way that reflected my style and personality.

Overall, this experience has helped me grow both technically and creatively. I've learned not only how to build a functional web portfolio, but also how to enjoy the process of designing and creating something of my own. It's an experience I'll look back on with pride and enthusiasm for what I can create next.
